The product has a carcinogenic effect on humans by inhalation. There is sufficient evidence to establish a causal link between human exposure to the substance contained in the product and the development of tumors. The product is to be considered with suspicion due to possible mutagenic effects. However, insufficient information is available to definitively demonstrate hereditary genetic alterations. The product has a teratogenic effect on humans and causes a toxic effect on the development of the fetus. The product can produce functional disturbances or morphological changes, due to repeated and prolonged exposure and / or presents concern for the possibility of accumulation in the human body.

The product is corrosive and causes severe burns and blisters on the skin. In the acute phase, erythema, edema and exudation prevail. In chronic phases, scales, dryness, fissuring and thickening of the skin prevail.

In contact with the eyes it causes serious injuries and can cause opacity of the cornea, iris injury, irreversible eye coloring. Any vapors are caustic to the respiratory system and can cause pulmonary edema, the symptoms of which sometimes appear after a few hours.
